What is **ClearSmile**[®] INVISIBLE ALIGNERS?

ClearSmile Invisible Aligners (CSIA) system is made possible with the advancement of 3D technologies that enables teeth straightening becoming more predictable, effective and in a shorter treatment time.

CSIA treatment consists of a series of aligners which are digitally designed and divided into multiple steps to be worn for over a period of 6 to 15 months depending on the complexity of the teeth misalignment.

Every step of the CSIA treatment consists of 3 thicknesses which are to be worn each weekly starting from soft, medium to hard.

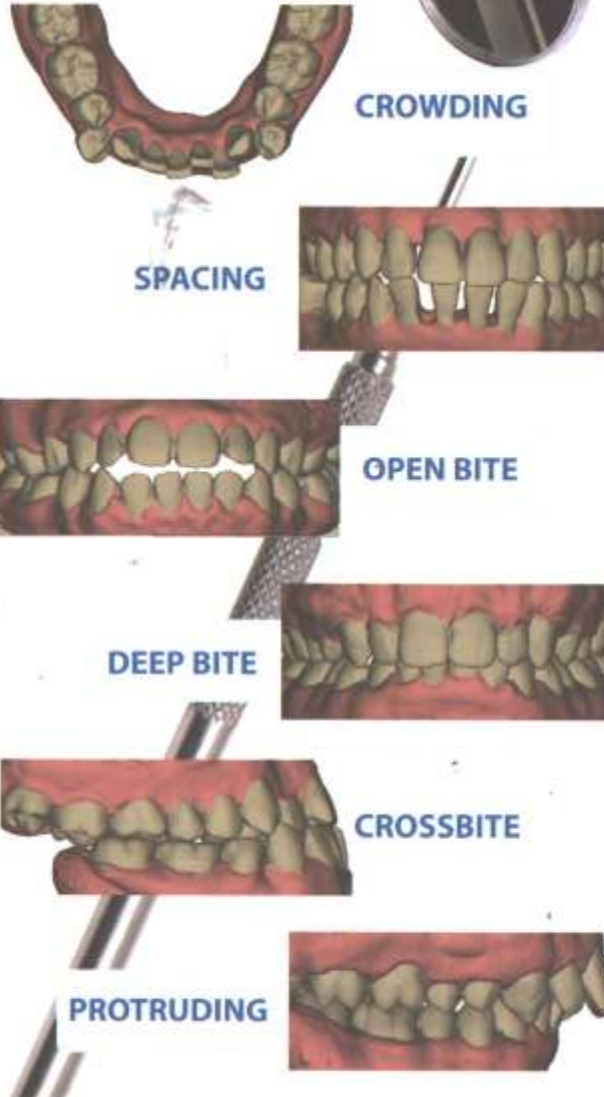

Clinical research has shown evidence that the use of soft aligners at the beginning of each treatment phase is of critical importance, both for clinical comfort and biologically more acceptable as compared to conventional single thickness aligner in the market or conventional braces.

The soft aligner that is worn in the first week, triggers only very minimal biological energies that will stimulate the reorganization processes within the Desmodont (attachment between teeth and bone), the soreness from pressure can therefore be reduced to the minimal. This will ensure that the patient will feel more comfortable using the aligners and the movement of teeth is as gentle as possible.
